IT252

Lab Manual

for

Database Systems Lab

LAB OBJECTIVE

Upon successful completion of this Lab the student will be able to:

- Creating database objects
- Modifying database objects
- Manipulating the data
- > Retrieving the data from the database server
- > Performing database operations in a procedural manner using pl/sql
- Performing database operations (create, update, modify, retrieve, etc.,)
- > Design and Develop applications like banking, reservation system, etc.,

INDEX

EX .NO	LIST OF EXPERIMENTS
1	Implement Data Definition Language commands
2	Implement Constraints
3	Implement Data Manipulation Language(DML)
4	Implement Data Control Language (DCL)commands
5	Computations done on data
6	Nested Queries and Joins
7	Views
8	Functions and Procedures
9	cursors
10	Triggers
11	Normalization
12	Third normal form

EXPERIMENT NO: 1

DATA DEFINITION LANGUAGE (DDL) COMMANDS

AIM:

To execute and verify the Data Definition Language commands.

OBJECTIVES

To understand DDL commands.

THEORY

The commands used are:

- CREATE It is used to create a table.
- ALTER The structure of a table can be modified by using the ALTER TABLE command. This command is used to add a new column, modify the existing column definition and to include or drop integrity constraint.
- DROP It will delete the table structure provided the table should be empty.
- TRUNCATE If there is no further use of records stored in a table and the structure has to be retained, and then the records alone can be deleted.
- DESC This is used to view the structure of the table

PROCEDURE

CREATION OF TABLE:

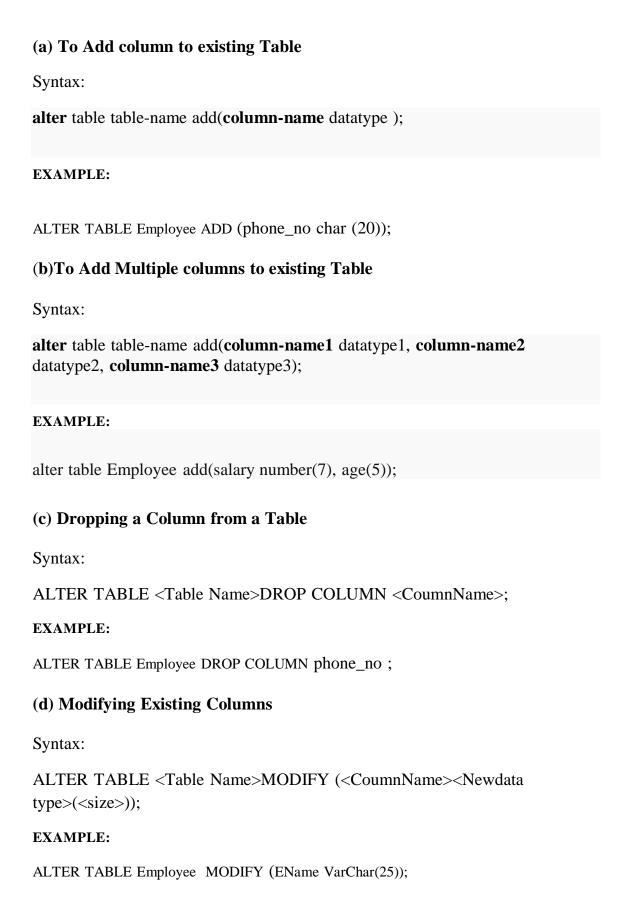

SYNTAX:

create table(column1 datatype,column2 datatype...);

EXAMPLE:

SQL>CREATE TABLE Employee (EmpNo number(5), EName VarChar(15), Job Char(10), DeptNo number(3));

ALTER TABLE

Using alter command we can rename an existing column
Syntax:
alter table table-name rename old-column-name to column-name;
EXAMPLE:
alter table Employee rename address to Location;
RENAMING TABLES
Syntax:
Rename <oldtable> to <new table="">;</new></oldtable>
EXAMPLE: rename Employee to Employee 1;
TRUNCATE TABLE
Syntax:
TRUNCATE TABLE <table name="">;</table>
Example:
Truncate table Employee;
DESTROYING TABLES
Syntax:
DROP TABLE <table name="">;</table>
Example:

(e) To Rename a column

DROP TABLE Employee;

DESCRIBE TABLES

. Syntax:

DESC <TABLE NAME>;

Example:

desc employee;

RESULT:

The DDL commands have been executed successfully

Problems

1. Create the tables described below

Table Name: PRODUCT_MASTER

Description : used to store product information

Column name	Data type	size
PRODUCTNO	Varchar2	6
DESCRIPTION	Varchar2	15
PROFITPERCENT	Varchar2	4,2
UNITMEASURE	Varchar2	10
QTYONHAND	Number	8
REORDERLVL	Number	8
SELLPRICE	Number	8,2
COSTPRICE	Number	8,2

Table Name : CLIENT_MASTER

Description : used to store client information

Column name	Data type	size
CLIENTNO	Varchar2	6
NAME	Varchar2	20
ADDRESS1	Varchar2	30
ADDRESS2	Varchar2	30
CITY	Varchar2	15
PINCODE	Number	8
STATE	Varchar2	15
BALDUE	Number	10,2

Table Name : SALESMAN_MASTER

Description : used to store salesman information working for the company

Column name	Data type	size
SALESMANNO	Varchar2	6
SALESMANNAME	Varchar2	20
ADDRESS1	Varchar2	30
ADDRESS2	Varchar2	30
CITY	Varchar2	15
PINCODE	Number	8
STATE	Varchar2	15

Table Name: STUDENT

Description : used to store student information

Column name	Data type	size
SNO	Number	5
SNAME	Varchar2	20
AGE	Number	5
SDOB	Date	
SMARK1	Number	4,2
SMARK2	Number	4,2
SMARK3	Number	4,4

2. Exercise on altering the table structure

- (a) Add a column called 'telephone' of data type 'number' and size ='10' to the Client _Master table.
- (b)Change the size of Sellprice column in Product_Master to 10,2

3. Exercise on deleting the table structure along with the data

(a)Destroy the table Client_Master along with its data

4. Exercise on renaming the table

(a)Change the name of the Salesman_Master table to sman_mast

EXPERIMENT NO:2 CONSTRAINTS

AIM:

To implement Data Constraints.

THEORY

Constraints are the business Rules which are enforced on the data being stored in a table are called *Constraints*

TYPES OF CONSTRAINTS:

- 1) Primary key
- 2) Foreign key/references
- 3) Check
- 4) Unique
- 5) Not null
- 6) Null
- 7) Default

PROCEDURE

(a) The PRIMARY KEY

The PRIMARY KEY defined at column level

Syntax:

CREATE TABLE tablename (Columnname1 DATATYPE CONSTRAINT <constraintname1> PRIMARY KEY,Columnname2 DATATYPE, columnname3 DATATYPE,....);

EXAMPLE

SQL>create table Employee(empno number(4) **primary key**,ename varchar2(10),job varchar2(6),sal number(5),deptno number(7));

The PRIMARY KEY defined at table level

Syntax:

CREATE TABLE tablename (Columnname1 DATATYPE, columnname2 DATATYPE, columnname3 DATATYPE, PRIMARY KEY (columnname1, columnname2));

EXAMPLE

(b) CHECK CONSTRAINT

The CHECK Constraint defined at column level

Syntax:

CREATE TABLE tablename (Columname1 DATATYPE CHECK (logical expression), columname2 DATATYPE, columname3 DATATYPE,...);

EXAMPLE

CREATE TABLE Employee(empno number(3),ename varchar2(20),design varchar2(15),sal number(5) CHECK(sal>500 and sal<10001),deptno number(2));

The CHECK Constraint defined at table level

Syntax:

CREATE TABLE tablename (Columnname1 DATATYPE, columnname2 DATATYPE, columnname3 DATATYPE, CHECK (logical expression1), CHECK (logical expression2));

EXAMPLE

CREATE TABLE Employee(empno number(3),ename varchar2(20), design varchar2(15),sal number(5),deptno number(2), CHECK(sal>500 and sal<1000));

(c) UNIQUE CONSTRAINT

The UNIQUE Constraint defined at the column level

Syntax

CREATE TABLE tablename (Columname1 DATATYPE UNIQUE, columname2 DATATYPE UNIQUE, columname3 DATATYPE ...);

EXAMPLE

sql>CREATE TABLE Employee(empno number(3),ename varchar2(20), design varchar2(15),sal number(5), UNIQUE(design));

The UNIQUE Constraint defined at the table level

Syntax

CREATE TABLE tablename (Columnname1 DATATYPE, columnname2 DATATYPE, columnname3 DATATYPE, UNIQUE (columnname1));

EXAMPLE

sql>create table Employee(empno number(3),ename varchar2(20), design varchar2(15),sal number(5), UNIQUE(design));

(d) Not Null

Syntax

CREATE TABLE tablename(Columnname1 DATATYPE NOT NULL, columnname2 DATATYPE NOT NULL,columnname3 DATATYPE,...);

EXAMPLE

sql>CREATE TABLE Employee(empno number(4),ename varchar2(20) NOT NULL,design varchar2(20),sal number(3));

Problems

1.Create the tables described below

 $Table\ Name: PRODUCT_MASTER$

Description : used to store product information

Column name	Data type	size	Attributes
PRODUCTNO	Varchar2	6	Primary key/first letter must start with 'p'
DESCRIPTION	Varchar2	15	Not Null
PROFITPERCENT	Varchar2	4,2	Not Null
UNITMEASURE	Varchar2	10	Not Null
QTYONHAND	Number	8	Not Null
REORDERLVL	Number	8	Not Null
SELLPRICE	Number	8,2	Not Null,cannot be 0
COSTPRICE	Number	8,2	Not Null,cannot be 0

Table Name : CLIENT_MASTER

Description : used to store client information

Column name	Data type	size	Attributes
CLIENTNO	Varchar2	6	Primary key/first letter must start with 'C'

NAME	Varchar2	20	Not Null
ADDRESS1	Varchar2	30	
ADDRESS2	Varchar2	30	
CITY	Varchar2	15	
PINCODE	Number	8	
STATE	Varchar2	15	
BALDUE	Number	10,2	

Table Name : SALESMAN_MASTER

Description : used to store salesman information working for the company

Column name	Data type	size	Attributes
SALESMANNO	Varchar2	6	Primary key/first letter must start with 'S'
SALESMANNAME	Varchar2	20	Not Null
ADDRESS1	Varchar2	30	Not Null
ADDRESS2	Varchar2	30	
CITY	Varchar2	15	
PINCODE	Number	8	
STATE	Varchar2	15	

EXPERIMENT NO 3 DATA MANIPULATION LANGUAGE

AIM:

To execute the Data Manipulation Language (DML) commands in RDBMS.

OBJECTIVES

To understand Data Manipulation Language (DML) commands

THEORY

DML commands are the most frequently used SQL commands and is used to query and manipulate the existing database objects. Some of the commands are

1. INSERT

This is used to add one or more rows to a table. The values are separated by commas and the data types char and date are enclosed in apostrophes. The values must be entered in the same order as they are defined.

2. SELECT

It is used to retrieve information from the table.it is generally referred to as querying the table. We can either display all columns in a table or only specify column from the table.

3. UPDATE

It is used to alter the column values in a table. A single column may be updated or more than one column could be updated.

4. **DELETE**

After inserting row in a table we can also delete them if required. The delete command consists of a from clause followed by an optional where clause

PROCEDURE

INSERT COMMAND

(a) Inserting a single row into a table:

Syntax:

insert into values (<expression1>,<expression2>)

Example:

SQL>INSERT INTO EMPLOYEE VALUES(101, 'MANU', 'LECTURER', 15000);

(b) Inserting more than one record using a single insert commands:

Syntax:

insert into values (&col1, &col2,)

Example:

SQL> INSERT INTO EMPLOYEE VALUES(&EMPNO,'&ENAME','&DESIGNATIN','&SALARY');

(c) Skipping the fields while inserting:

Insert into <tablename>(<column name1>,<column name3>)>values (<expression1>,<expression3>);

Other way is to give null while passing the values.

SELECT COMMAND

(a) view all rows and all columns

Syntax:

Select * from tablename;

Example:

Select * from Employee;

(b) Selected Columns And All Rows

Syntax:

Select <column1>,<column2> from tablename;

Example:

Select empno, empname from Employee;

(c)Selected Columns And selected Rows

Syntax:

SELECt <column1>, <column2> FROM <tablename> WHERE <condition> ;

Example:
Select empno, empname from Employee where designation='lecturer';
(c)Eliminating duplicate rows
Syntax:
SELECT DISTINCT <column1>, <column2> FROM <tablename></tablename></column2></column1>
Example:
Select distinct empname from Employee;
<u>UPDATE COMMAND</u>
(b)updating all rows
Syntax:
<pre>update tablename set columnname1>=<exprssion1>,<columnname2>=<exprssion2>;</exprssion2></columnname2></exprssion1></pre>
Example:
Update Employee set Designation = 'lecturer';
(b)updating records conditionally
Syntax:
update tablename set field=values where condition;
Example:
Update Employeeemp set sal = 10000 where empno=135;
DELETE COMMAND
(b)Removal of all rows
Syntax:

Delete from	,
	_

Example:

Delete from emp;

(b)removal of specific rows

Syntax:

Delete from where <condition>;

Example:

delete from emp where empno=135;

RESULT

The DML commands are executed successfully.

Problems

1. Insert the following data into their respective tables.

Data for CLIENT_MASTER table

ClientNo	Name	City	Pincode	State	BalDue
C00001	Ivan	Mumbai	400054	Maharashtra	15000
C00002	Ashwini	Chennai	780001	TamilNadu	0
C00003	Joshi	Mangalore	560001	Karnataka	5000
C00004	Deepak	Chennai	780001	TamilNadu	0
C00005	Sharma	Mumbai	400054	Maharashtra	2000

Product	Descripti	Profitpe	unitmeas	qtyonha	sellpri	Cost
No	on	rcent	ure	nd	ce	price
P00001	Tshirt	5	piece	200	350	250
P00065	Shirt	6	piece	150	500	350
P00032	Jeans	5	piece	100	600	450
P00324	Skirts	4	piece	120	750	500
P02345	CottonJe ans	3	piece	80	850	550

2. Data for PRODUCT_MASTER table

Sales	Name	Address1	Address2	city	Pincode	State
manN						
О						
S0000	Aman	A/4	Worli	Mumbai	400002	Maharashtra
1						
S0000	Omkar	65	Nariman	Mumbai	400001	Maharashtra
2						
S0000	Raj	P-7	Bandra	Mumbai	400032	Maharashtra
3						
S0000	Ashish	A/5	Juhu	Mumbai	400044	Maharashtra
4						
	1	1			l	l .

3. Data for SALESMAN_MASTER table

4. Exercise on retrieving records from a table

- a. Find out the names of all clients
- b. Retrieve the entire contents of the Client master table
- c. Retrieve the list of names, city and the state of all the clients
- d. List the various products available from the Product _Master table
- e. List all the clients who are located in Mumbai
- f. Find the names of salesmen who have a salary equal to Rs.3000

5. Exercise on updating the records on a table

- a. Change the city of ClientNo'C00005' to 'Bangaluru'.
- b. Change the cBalDue of ClientNo'C00001' to Rs.1000.
- c. Change the costprice of 'Shirt' to Rs.450.
- d. Change the city of salesman to Pune.

6. Exercise on deleting the records in a table

- a. Delete all salesman from the Salesman_master whose salaries are equal to Rs.3500.
- b. Delete all sproducts from the Product_master where quantity on hand is equal to 100
- c. Delete from the Client_master where the column state holds the value 'Tamilnadu'.

EXPERIMENT NO:3 DATA CONTROL LANGUAGE

AIM:

To implement DCL statements.

OBJECTIVES

To understand DCL commands

THEORY:

Data Control Language (DCL) consists of various commands which are related to data sharing and security of data in database.

They are

GRANT

REVOKE

Granting Privileges:

Objects that are created by a user are owned and controlled by that user. If user wishes to access any of the objects belonging to another user, the owner of the object will have to give permissions for such access. This is called Granting of Privileges.

Granting privileges using the GRANT statements:

The GRANT statements provide various types of access to database objects such as tables, views.

Syntax:

GRANT {object privileges}

ON object name

TO username;

Object Privileges:

each object privilege that is granted authorizes the grantee to perform some operation on the object. The user can grant all the privileges or grant only specific object privileges.

The list of object privileges is as follows:

- **ALTER:** allows the grantee to change the table definitions with the ALTER table command.
- **DELETE:** allows the grantee to remove the records from the table with the DELETE command.
- **INDEX:** allows the grantee to create an index on the table with the CREATE INDEX command.
- **INSERT:** allows the grantee to add records to the table with the INSERT command.
- **SELECT:** allows the grantee to query the table with SELECT command.
- **UPDATE:** allows the grantee to modify the records in the table with the UPDATE command.

Revoking privileges given:

Privileges once given can be denied to a user using the REVOKE command. The object owner can revoke privileges granted to another user. A user of an object who is not owner, but has been granted the GRANT privilege, has the power to REVOKE the privileges from the grantee.

Revoking permission using the REVOKE statement:

The REVOKE statement is used to deny the grant given on an object.

Syntax:

REVOKE {object privileges}

ON object name

FROM username;

The REVOKE command is used to revoke object privileges that the user previously granted to the Revoke.

The REVOKE co	mmand	cannot	be used	to 1	revoke	the	privileges	grante	d
through operating	system.								

RESULT:

Familiarised DCL statements.

EXPERIMENT NO:5 COMPUTATIONS ON TABLE DATA WITH BUILT IN FUCTIONS

AIM:

To implement computations done on data of the given table

OBJECTIVES

To understand computations done on data of the given table with built in functions

THEORY

Group Functions/Aggregate functions

A group function returns a result based on group of rows.

1. avg

Example: select avg (total) from student;

2.max

Example: select max (percentagel) from student;

2.min

Example: select min (marksl) from student;

4. sum

Example: select sum(price) from product

Count Function

In order to count the number of rows, count function is used.

1. count(*) – It counts all, inclusive of duplicates and nulls.

Example: select count(*) from student;

2. count(col_name)— It avoids null value.

Example: select count(total) from order;

2. count(distinct col_name) – It avoids the repeated and null values.

Example: select count(distinct ordid) from order;

Special Clauses:

Group by clause

This allows us to use simultaneous column name and group functions.

Example: Select max(percentage), deptname from student group by deptname;

Having clause

This is used to specify conditions on rows retrieved by using group by clause.

Example: Select max(percentage), deptname from student group by deptname having count(*)>=50;

In / not in – used to select a equi from a specific set of values

Any - used to compare with a specific set of values

Between / not between – used to find between the ranges

Like / not like – used to do the pattern matching

PROCEDURE

OUTPUT

RESULT

PROGRAMS

1. generate SQL statements to perform the following computations on table data.

a.list the names of all clients having 'a' as the second letter in their names.

b.listing of clients who stay in a city whose first letter is 'M'

c.list all clients who stay in 'Bangaluru' or 'Mangalore'

d.list all clients whose BalDue is greater than 10000

e.display the order information of clientno 'C00001' and 'C00002'

f.list products whose selling price is greater than 500 and less than or equal to 750

g.listing of names, city and state of clients who are not in the state of 'maharashtra'.

h.count the total number of orders

i.calculating the average price of all products.

j.determining the maximum and minimum price for the product prices.

k.count the number of products having the price greater than or equal to 500

2.SQL statements for using having and group by clauses.

- a. printing the description and total quantity sold for each product.
- b. Finding the value of each product sold
- c. find out the total of all the billed orders for the month of june.

EXPERIMENT NO:6 NESTED QUERIES/SUB QUERIES AND JOINS

AIM:

To implement e nested queries and joins on the given table

OBJECTIVES

To understand nested queries and joins.

THEORY

a) NESTED QUERIES:

A sub query is a query within a query. In Oracle, we can create sub queries within your SQL statements. These sub queries can reside in the WHERE clause, the FROM clause, or the SELECT clause.

b) JOINS:

Join is a query in which data is returned from two or more tables.

Natural join:

It returns the matching rows from the table that are being joined

Syntax:

>select <attribute> from TN where TN1.attribute=TN2.attribute.

Inner join:

It returns the matching rows from the table that are being joined.

Syntax:

>select <attribute> from TN1 innerjoin TN2 on TN1.attribute=TN2.attribute.

Left outer join:

It returns all the rows from the table1 even when they are unmatched.

Syntax:

- 5. select <attribute> from TN1 left outer join TN2 on TN1.attribute=TN2.attribute.
- 2. select <attribute> from TN where TN1.attribute(+)=TN2.attribute.

Right outer join:

It returns all the rows from the table2 even when they are unmatched.

Syntax:

- 4. select <attribute> from TN1 right outer join TN2 on TN1.attribute=TN2.attribute.
- 2. select <attribute> from TN where TN1.attribute=(+)TN2.attribute.

Full join:

It is the combination of both left outer and right outer join.

Syntax:

>select <attribute> from TN1 full join TN2 on TN1.attribute=TN2.attribute.

PROCEDURE

NESTED QUERIES -

wahab 10 fathi 12 priya 11 10 rows selected.

RESULT:

Thus the nested queries and join operations are executed and verified n DBMS.

Programs

- 1. Exercises on sub-queries
- a) find the non moving products ie products not being sold.
- b) Find the name and complete address for the customer who has placed order number 'o19001'
- c) find the clients who have placed orders before the month of may '02
- d) find the names of clients who have placed orders worth Rs.10000 or more.

EXPERIMENT NO:7 VIEWS

AIM:

To create and drop View on the given table.

OBJECTIVES

To implement views

THEORY

A view is the tailored presentation of data contained in one or more table and can also be said as restricted view to the data"s in the tables. A view is a "virtual table" or a "stored query" which takes the output of a query and treats it as a table. The table upon which a view is created is called as base table. A view is a logical table based on a table or another view. A view contains no data of its own but is like a window through which data from tables can be viewed or changed. The tables on which a view is based are called base tables. The view is stored as a SELECT statement in the data dictionary.

Advantages of a view:

- a. Additional level of table security.
- b. Hides data complexity.
- c. Simplifies the usage by combining multiple tables into a single table

Creating and dropping view:

Syntax:

Create or replace view view_name AS SELECT column_name(s) FROM table_name WHERE condition

Drop view <view name>;

Example

Create or replace view empview as select * from emp;

Drop view empview;

PROCEDURE

1) create a table aa

`SQL> create table aa(name varchar2(20),book number(10),edition number(20),price number(20), ISBN number(20));

2) describe the table aa

SQL> select * from aa;

NAME	BOOK	EDITION	PRICE	ISBN
Bb	23	2001	12	23435

ee 44

00.87

8 rows selected.

Result

Thus the view creation commands are executed successfully

Problems

1)Create the following table and insert rows

Table:Hosp_doc

Column name	Data type and size
Doc_code	Varchar2(4)
Doc_name	Varchar2(4)
Specialization	Varchar2(4)
Department	Varchar2(4)
Date_of_join	Date
Exper	Number(2)

- 1)create a view vw_doctor on Hosp_doc table
- 2) create another view that contains doctor codes and doctor names of 'orthology' department
- 3)delete the view vw_doctor

EXPERIMENT NO:8 FUNCTIONS AND PROCEDURE

AIM:

To find factorial of a number using function

OBJECTIVES

To write PL/SQL(Functions) and to understand stored procedures in SQL.

THEORY

FUNCTION:

A function is a subprogram that computes a value.

syntax

Create or replace functionfunction_namepage function

Return datatype is

(local declaration)

begin

(executable statements)

[Exception]

(exception handlers)

End

PROCEDURE:

create [or replace] procedure procedurename

[parameter[in/out/in/in out] datatype

[:=/default expression]

[(parameter)]

is/as

declaration

begin

pl/sql codes

[exception]

end

PROGRAM

```
SQL> create or replace function fact(a number) return number as
i number;
f number;
begin
f:=1;
i:=1;
while (i<=a)
loop
f:=f*i;
i:=i+1;
end loop;
return f;
end fact; /Function created.
SQL>begin
2 dbms_output.put_line('the factorial='||fact(&a));
3* end;
```

OUTPUT

```
SQL>/
Enter value for a: 4
old 2: dbms_output.put_line('the factorial='||fact(&a))
new 2: dbms_output.put_line('the factorial='||fact(4));
the factorial=24
PL/SQL procedure successfully completed.
```

RESULT:

Thus the functions and stored procedures are executed in SQL.

Problems:

- 1) procedure to find whether a given number is odd or even
- 2) procedure to display 1-10 using while
- 3) Procedure to display some numbers lesser than given number

EXPERIMENT NO: 9 CURSOR

AIM

To retrieve all students who have registered for Diploma and store their details into another table called diploma (id,name) using cursors.

OBJECTIVES

To implement cursor

PROCEDURE

```
1) TABLE CREATION
SQL>create table student(id number,name varchar2(25),programme varchar2(25));
SQL>create table diploma(id number,name varchar2(25));
SQL>insert into students values(1,'rohan','diploma');
SQL>insert into students values(2,'anu','MA');
SQL>insert into students values(3,'robert','diploma');
SQL>insert into students values(4,'tom','btech');
SQL>insert into students values(5,'sunny','diploma');
```

```
Id name programme
```

SQL>select * from students;

1	rohan	diploma
2	anu	MA
3	robert	diploma
4	tom	btech
5	sunny	diploma

SQL>declare

2 cursor stud is select * from students where programme ="diploma';

- 3 id students.id%type;
- 4 name students.name%type
- 5 prog students.programme%type
- 6 begin
- 7 open stud;
- 8 loop
- 9 fetch stud into id,name,prog;
- 10 exit when stud%notfound;
- insert into diploma values(id,name);
- 12 endloop;
- 13 end;
- 14 /

OUTPUT

RESULT

PROGRAMS

1.A HRD manager has decided to raise the salary of all employees in department number 20 by 0.05. Whenever such raise is given to the employees, the employee number , the date when raise was given and raise amunt are maintained in the emp_raise table. Write a PL/SQL block using cursors to update the salary of each employee of dept no 20 and insert a record in the emp_raise table as well

EXPERIMENT NO: 10 TRIGGER

<u>AIM</u>

Create a Trigger for EMP table it will update another table SALARY while inserting values

OBJECTIVES

To develop and execute a Trigger for Before and After update/Delete/Insert operations on a table

THEORY.

PROCEDURE

step 1: start

step 2: initialize the trigger with specific table id.

step 3:specify the operations (update, delete, insert) for which the trigger has to be executed.

step 4: execute the trigger procedure for both before and after sequences

step 5: carryout the operation on the table to check for trigger execution.

step 6: stop

PROGRAM

sql> create table emp(iname varchar2(10),iid number(5),salary number(10));

table created.

sql> create table sal(iname varchar2(10),totalemp number(5),totalsal number(10));

table created.

sql> create or replace trigger emptrigr after insert on emp

for each row

declare

a varchar2(10);

begin

a:=:new.iname;

update sal set

totalsal=totalsal+:new.salary,totalemp=totalemp+1 where

iname=a;

```
end;
trigger created.
sql> insert into emp values('vec',100,1000);
1 row created.
sql> insert into sal values('vec',0,0);
1 row created.
sql> insert into sal values('srm',0,0);
1 row created.
sql> select * from sal;
iname
            totalemp
                         totalsal
            1
                         1000
vec
            0
                         0
srm
sql> insert into emp values('srm',200,3000);
1 row created.
sql> select * from sal;
            totalemp
iname
                         totalsal
_____
Vec
            1
                        1000
            1
                        3000
srm
sql> insert into emp values('vec',100,5000);
1 row created.
sql> select * from sal;
iname totalemp totalsal
______
            2
                  6000
vec
srm
            1
                  3000
sql> insert into emp values('vec',100,2000);
1 row created.
sql> select * from sal;
iname totalemp totalsal
vec 3
                  8000
                  3000
srm 1
sql> insert into emp values('srm',200,8000);
```

1 row created.

sql> select * from sal; iname totalemp totalsal

Vec 3 8000 Srm 2 11000

RESULT:

The trigger procedure has been executed successfully for both before and after sequences.

Problems

- 1. Write a trigger that stores the details of students changing their program from CT to CHM.
- 2. Write an update trigger on CLIENT_MASTER table. The system should keep track of the records that are being updated. The old values of the updated record should be added in the AUDIT_TRAIL table

Column name	Data type	size
Client_no	Varchar2	6
name	Varchar2	20
Bal_due	Number	10,2
Operation	Varchar2	8
userid	Varchar2	20
olddate	date	

Experiment No:11

CONCEPTS OF NORMALIZATION

AIM:Checking Normalization of a database table (First Normal form)

Problem Statement:

An exercise to check whether the given database table is normalized or not. If yes find out the status of normalization and reasoning.

Objective:

To study the concept of various levels of normalization and understand how to convert into normalized forms.

Requirements: Mysql database software

Design/Theory

Create a database table in SQL with a few no of rows and columns. Analyze the table and determine to which normal form it belongs to according to the rules and regulations of each normal forms.

Procedure:

Consider a student table as given below

Social Security Number	FirstName	LastName	Major
123-45-6789	Jack	Jones	Library and Information Science
222-33-4444	Lynn	Lee	Library and Information Science
987-65-4321	Mary	Ruiz	Pre-Medicine
123-54-3210	Lynn	Smith	Pre-Law

We can easily verify that this table satisfies the definition of 1NF: viz., it has no duplicated rows; each cell is single-valued (i.e., there are no repeating groups or arrays); and all the entries in a given column are of the same kind. In this table we can see that the key, SSN, functionally determines the other attributes; i.e.,FirstName, LastName, and Major.

Experiment No:12

Checking Normalization of a database table(Third normal form). Problem Statement:

An excercise to check whether the given database table is normalized or not. If yes find out the status of normalization and reasoning.

Objective:

To study the concept of various levels of normalization and understand how to convert into normalized forms.

Requirements: Mysql database software

Design/Theory

Create a database table in SQL with a few no of rows and columns. Analyze the table and determine to which normal form it beongs to according to the rules and regulations of each normal forms.

Procedure:

Consider a book database table as given below.

Author Last Name	Author First Name	Book Title	Subject	Collection or Library	Building
Berdahl	Robert	The Politics of the Prussian Nobility	History	PCL General Stacks	Perry- Castañeda Library
Yudof	Mark	Child Abuse and Neglect	Legal Procedure s	Law Library	Townes Hall
Harmon	Glynn	Human Memory and Knowledge	Cognitive Psycholog y	PCL General Stacks	Perry- Castañeda Library
Graves	Robert	The Golden Fleece	Greek Literature	Classics Library	Waggener Hall
Miksa	Francis	Charles Ammi Cutter	Library	Library and	Perry-

			Biograph y	Information Science Collection	Castañeda Library
Hunter	David	Music Publishing and Collecting	Music Literature	Fine Arts Library	Fine Arts Building
Graves	Robert	English and Scottish Ballads	Folksong	PCL General Stacks	Perry- Castañeda Library

By examining the table, we can infer that books dealing with history, cognitive psychology, and folksong are assigned to the PCL General Stacks collection; that books dealing with legal procedures are assigned to the Law Library; that books dealing with Greek literature are assigned to the Classics Library; that books dealing with library biography are assigned to the Library and Information Science Collection (LISC); and that books dealing with music literature are assigned to the Fine Arts Library.

Moreover, we can infer that the PCL General Stacks collection and the LISC are both housed in the Perry-Castañeda Library (PCL) building; that the Classics Library is housed in Waggener Hall; and that the Law Library and Fine Arts Library are housed, respectively, in Townes Hall and the Fine Arts Building.

Thus we can see that a transitive dependency exists in the above table: any book that deals with history, cognitive psychology, or library biography will be physically housed in the PCL building (unless it is temporarily checked out to a borrower); any book dealing with legal procedures will be housed in Townes Hall; and so on. In short, if we know what subject a book deals with, we also know not only what library or collection it will be assigned to but also what building it is physically housed in.

A problem with transitive dependency is that, there is duplicated information: from three different rows we can see that the PCL General Stacks are in the PCL building. For another thing, we have possible deletion anomalies: if the Yudof book were lost and its row removed from table, we would lose the information that books on legal procedures are assigned to the Law Library and also the information the Law Library is in Townes Hall. As a third problem, we have possible insertion anomalies: if we wanted to add a chemistry book to the table, we would find that the above table nowhere contains the fact that the

Chemistry Library is in Robert A.Welch Hall. As a fourth problem, we have the chance of making errors in updating: a careless data-entry clerk might add a book to the LISC but mistakenly enter Townes Hall in the building column.

To solve this problem decompose the above table into three different tables as follows

Table A

Author Last Name	Author First Name	Book Title
Berdahl	Robert	The Politics of the Prussian Nobility
Yudof	Mark	Child Abuse and Neglect
Harmon	Glynn	Human Memory and Knowledge
Graves	Robert	The Golden Fleece
Miksa	Francis	Charles Ammi Cutter
Hunter	David	Music Publishing and Collecting
Graves	Robert	English and Scottish Ballads

Table B

Book Title	Subject
The Politics of the Prussian Nobility	History

Child Abuse and Neglect Legal Procedures

Human Memory and Cognitive
Knowledge Psychology

The Golden Fleece Greek Literature

Charles Ammi Cutter Library Biography

Music Publishing and

Collecting

Music Literature

English and Scottish Ballads Folksong

Table C

Subject	Collection or Library
History	PCL General Stacks
Legal Procedures	Law Library
Cognitive Psychology	PCL General Stacks
Greek Literature	Classics Library
Library Biography	Library and Information Science Collection
Music Literature	Fine Arts Library
Folksong	PCL General Stacks

Table D

Collection or Library	Building
PCL General Stacks	Perry-Castañeda Library

Law Library Townes Hall

Classics Library Waggener Hall

Library and Information Science Perry-Castañeda

Collection Library

Fine Arts Library Fine Arts Building
